For Windows users, the new feature is called AdobeR. This option optimizes Photoshop even further by adding a more complex architecture that is more resilient against crashes and performance hits. Previous versions of the program were known for their stability, even without any add-ons. In version 12, the frame time is less than 0.5 of a second. This is thanks to the new architecture, which also creates a simplified and shorter history. Performance is also improved by reducing memory bloat, loading faster, and reducing the number of settings that can be changed on the fly. AdobeR also manages the persistence of content by migrating items that have not changed during the last 24 hours. This is done by letting users choose to restore and optimize the last backup and review the missing work while doing so. Tools have not yet been changed, but they should be very similar to their previous function. Adobe has introduced a variety of new features and improvements to Photoshop CC including Linked Smart Objects. AdobeR aims to optimize the software by adding a more complex architecture behind all of the new functions. Previously, Photoshop has always maintained its stability without any add-ons, and the performance of the program was never an issue. However, this set of features will be very useful for professional designers, as well as for regular users who need to edit photos often. But, while both the features debuted before Photoshop Elements, this set of features is brand new to Photoshop. When you update to Photoshop Elements 2018, you'll see a new Object Selection tool in the toolbox to select object outlines and make simple edits like merging, rotating, and moving them. The selection handles even adapt to shape ranges, making cutting and pasting items easier than ever. With the new fill and adjustment layers feature, you can build content-aware areas in layers that look at the entire photo area, rather than using the selection handles or anchors. And it is now easier to access the Content-Aware feature lets you brush on certain areas of the image to fill them, so you can edit content-aware areas, such as leaving parts of the subject's face exposed. Now, you'll be freed from the hassles of manually opening up the canvas and using powerful eyedropper tools to select image contents.
